

General purpose Arrow simulator

Now you can use your phone to do a page-up or a page-down, go Home or to the End, in any application — Word, iTunes, Keynote, whatever.

This means you read a document, start and stop a song, do a presentation, all with the same Clicker Script! You can even use the command-arrow-keys, as in iTunes and EyeTV, plus the spacebar, the escape key and command-tab. And if you really want to, you can simulate a mouse click...

Joystick or Volume up : page up

Joystick or Volume down : page down

Joystick left : home

Joystick right : end

2, 4, 6, 8 : arrow keys

5, 7, 9, 0 : command arrow keys

1 : page up

3 : page down

* : space bar

C : escape

Push or OK: mouse click

for T610 etc: press the camera button to switch between two applications, like command-tab does.

I think GP Arrows needs at least 10.2.8, with the System Events, but I'm not sure... Please let me know.
